

# COOLING SOLUTIONS

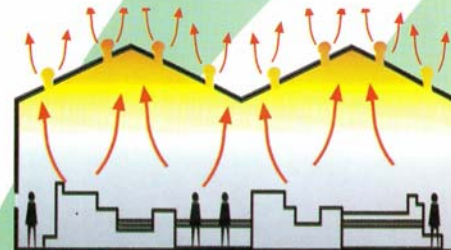

## Introducing a fresh natural solution to ventilation

### Benefits of turbines for the workplace

Eight out of ten industrial and commercial buildings in South Africa are inadequately ventilated. Turbine ventilators are designed to address your ventilation needs economically and efficiently. Turbo Vent's range of turbine ventilators extract hot, polluted, stale air from enclosed spaces, replacing it with fresh air from outside. Turbine ventilators transform hot, stuffy and polluted working environments within hours. The result is an improvement in staff comfort levels and an increase in productivity. Activated by convection and wind, turbines operate around the clock without consuming electricity. Their quiet, clean and effective operation ensures performance without disturbing employees. Improved air quality resulting from turbine ventilation increases the shelf life of perishable and heat sensitive merchandise and reduces deterioration of structural materials. Turbo Vent has the largest range of turbine ventilators in Southern Africa. Our turbine ventilators are manufactured to the highest international standards from the best materials available. Our network of trained dealers are able to analyse your premises and specify and install an effective turbine ventilation system.
